Data Scientist & Founder

Theano vs Keras

```python
import theano
import theano.tensor as T
from theano.ifelse import ifelse
import numpy as np
from random import random

# Define variables
x = T.matrix('x')
w1 = theano.shared(np.array([random(),random()]))
w2 = theano.shared(np.array([random(),random()]))
w3 = theano.shared(np.array([random(),random()]))
```

```python
a2 = 1/(1+T.exp(-T.dot(x,w2)-b1))
x2 = T.stack([a1,a2],axis=1)
a3 = 1/(1+T.exp(-T.dot(x2,w3)-b2))

a_hat = T.vector('a_hat') #Actual output
cost = -(a_hat*T.log(a3) + (1-a_hat)*T.log(1-a3)).sum()
dw1,dw2,dw3,db1,db2 = T.grad(cost,[w1,w2,w3,b1,b2])
```

```python
                    [w1, w1-learning_rate*dw1],
                    [w2, w2-learning_rate*dw2],
                    [w3, w3-learning_rate*dw3],
                    [b1, b1-learning_rate*db1],
                    [b2, b2-learning_rate*db2]
                ]
```

```python
# You can (finally) train your model
cost = []
for iteration in range(30000):
    pred, cost_iter = train(inputs, outputs)
    cost.append(cost_iter)
```

```python
from keras.layers import Dense
from keras.models import Sequential

# Define model and add layers
model = Sequential()
model.add(Dense(2,input_shape=(2,),activation='sigmoid'))
model.add(Dense(1,activation='sigmoid'))

model.compile(optimizer='adam',loss='categorical_crossentropy')

# Train model
model.fit(inputs,outputs)
```
Keras

- Deep Learning Framework

- Enables fast experimentation

- Runs on top of other frameworks

- Written by François Chollet

# Why use Keras?

- Fast industry-ready models

- For beginners and experts

- Less code

- Build any architecture

- Deploy models in multiple platforms

Keras + TensorFlow

- TensorFlow's high level framework of choice

- Keras is complementary to TensorFlow

- You can use TensorFlow for low level features

Feature Engineering

Unstructured data
So, when to use neural networks?

- Dealing with unstructured data

- Don't need easily interpretable results

- You can benefit from a known architecture

Example: Classify images of cats and dogs

- **Images -> Unstructured data**

- You don't care about why the network knows it's a cat or a dog

- You can benefit from convolutional neural networks
Let's practice!

Your first neural network

# A neural network?

Parameters

Gradient descent

The sequential API

The sequential API

The sequential API

Defining a neural network

```python
from keras.models import Sequential

from keras.layers import Dense

# Create a new sequential model
model = Sequential()

# Add and input and dense layer
model.add(Dense(2, input_shape=(3,)))

# Add a final 1 neuron layer
model.add(Dense(1))
```

Adding activations

```python
from keras.models import Sequential

from keras.layers import Dense

# Create a new sequential model
model = Sequential()

# Add and input and dense layer
model.add(Dense(2, input_shape=(3,)))

# Add a final 1 neuron layer
model.add(Dense(1))
```
Adding activations

```python
from keras.models import Sequential

from keras.layers import Dense

# Create a new sequential model
model = Sequential()

# Add and input and dense layer
model.add(Dense(2, input_shape=(3,),
                activation="relu"))

# Add a final 1 neuron layer
model.add(Dense(1))
```

Summarize your model!

```
model.summary()
```

```
Layer (type)                    Output Shape                    Param #
================================================================

dense_3 (Dense)                 (None, 2)                       8

----------------------------------------------------------------

dense_4 (Dense)                 (None, 1)                       3

================================================================
Total params: 11
Trainable params: 11
Non-trainable params: 0
```

Data Scientist & Founder

Recap

```python
from keras.models import Sequential
from keras.layers import Dense

# Create a new sequential model
model = Sequential()

# Add and input and dense layer
model.add(Dense(2, input_shape=(3,),
                activation="relu"))

# Add a final 1 neuron layer
model.add(Dense(1))
<
```
Compiling

```python
# Compiling your previously built model
model.compile(optimizer="adam", loss="mse")
```

Compiled ✔

Training

```python
# Train your model
model.fit(X_train, y_train, epochs=5)
```

```
Epoch 1/5
1000/1000 [==============================] - 0s 242us/step - loss: 0.4090
Epoch 2/5
1000/1000 [==============================] - 0s 34us/step - loss: 0.3602
Epoch 3/5
1000/1000 [==============================] - 0s 37us/step - loss: 0.3223
Epoch 4/5
1000/1000 [==============================] - 0s 34us/step - loss: 0.2958
Epoch 5/5
1000/1000 [==============================] - 0s 33us/step - loss: 0.2795
```

Predicting

```python
# Predict on new data
preds = model.predict(X_test)

# Look at the predictions
print(preds)
```
```
array([[0.6131608 ],
       [0.5175948 ],
       [0.60209155],
       ...,
       [0.55633   ],
       [0.5305591 ],
       [0.50682044]])
```
Evaluating

```
# Evaluate your results
model.evaluate(X_test, y_test)
```

```
1000/1000 [==============================] - 0s 53us/step
0.25
```
